\* Keep contact times as short as possible. After the cleaning process, the product-touched and nearby surfaces (e.g. leakage space at Mix Proof Valves) have to be flushed with pure water. Long contact times, especially with disinfectants, have to be avoided.

All information and values mentioned in this chart are solely intended for orientation and are not obligatory for the use of our valves with the respective seal material. This sealing guide was created in close cooperation with our suppliers of seals. Further, our decade-long experience in diverse applications are considered therein. However, the life cycle of seals can be additionally influenced by factual conditions of use, such as temperature changes, mechanical stresses of the seals, or media concentration in the system on site. These factors can only be evaluated in a detailed examination.

To determine a selection of seals for applications without existing experience, please contact us and please check all parameters in detail.
